

Model Context Protocol

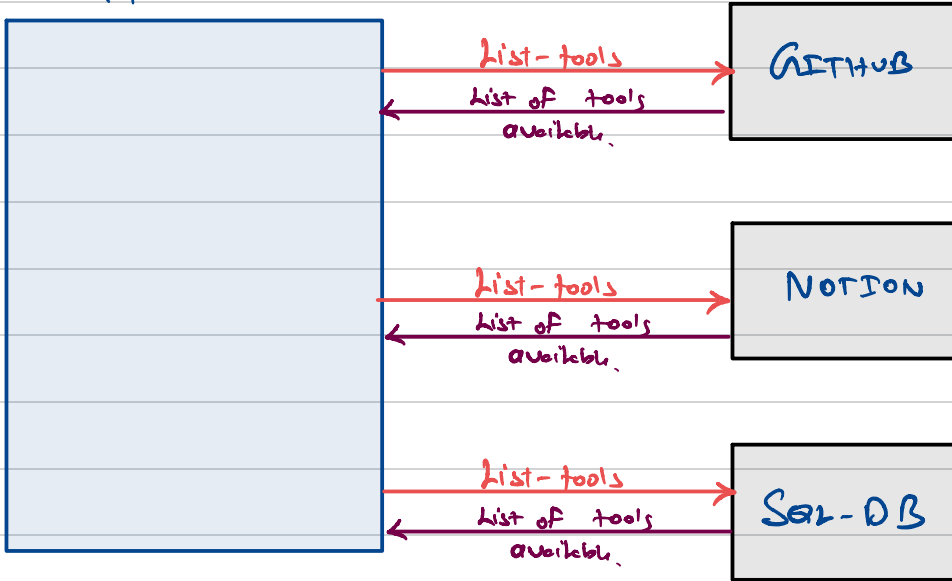

Model Context Protocol standardizes request/response structure b/w service-provider (like github, Gmail, etc) and a Host (Any AI Application)

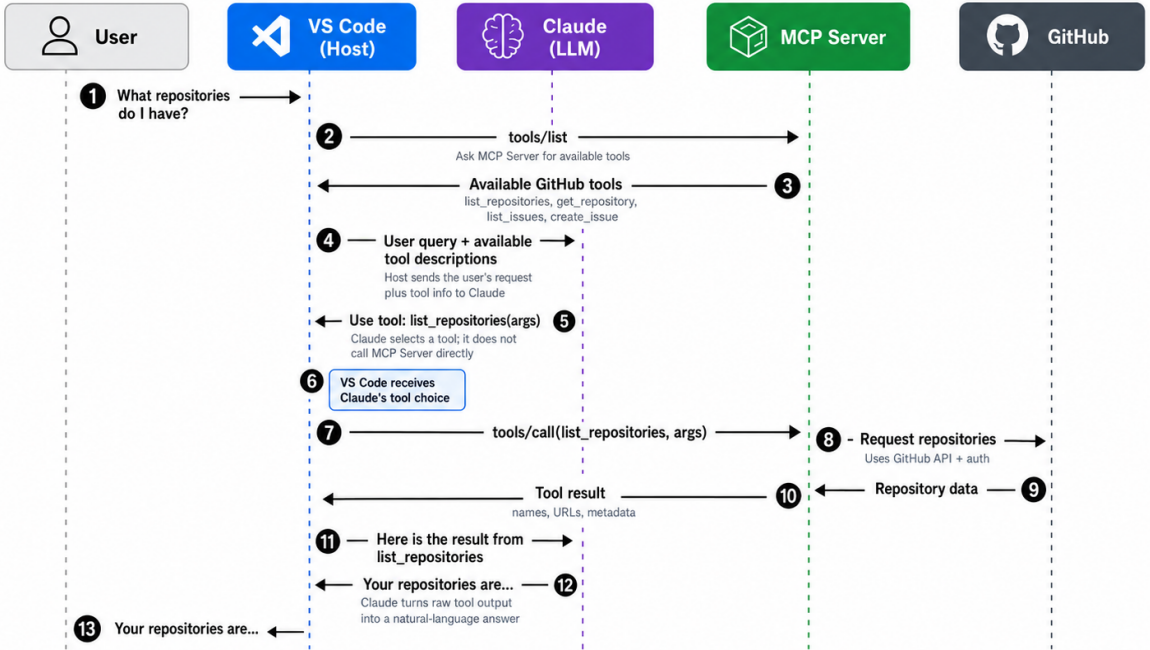

mcp Servers.

Host - User

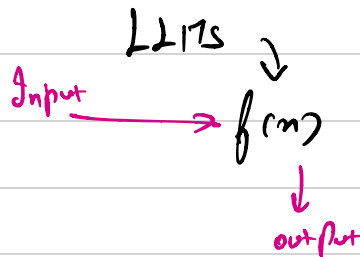

Clear MCP Flow with GitHub

The Host (VS Code) discovers tools, Claude selects a tool, and the Host executes it via the MCP Server

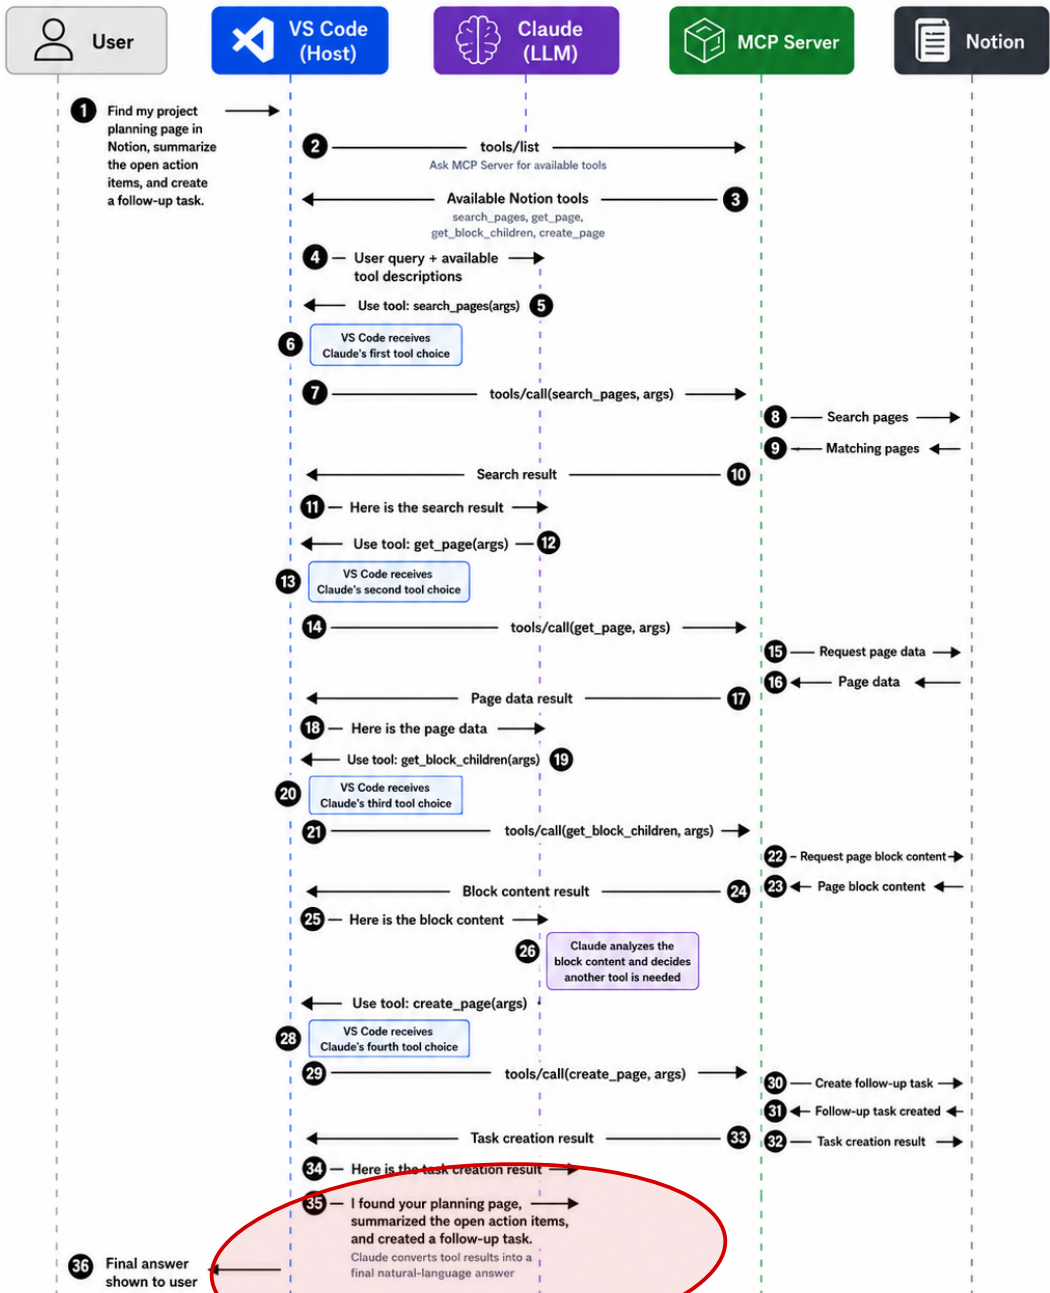

Key idea: The Host asks the MCP Server for tools, gives those tool descriptions to the LLM, the LLM selects a tool, and the Host executes it through the MCP Server. Claude never talks directly to GitHub.

I get confused with one thing, why host(vs code makes call to mcp), tools list and selection of tools are LLM responsibility?

Clear MCP Flow with Notion

The Host (VS Code) discovers tools, Claude selects tools step by step, and the Host executes them via the MCP Server

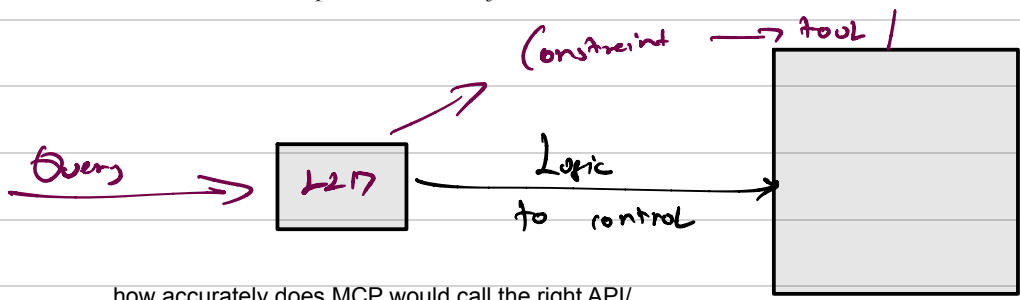

Key idea: The Host asks the MCP Server for tools, gives those tool descriptions and tool results to the LLM, the LLM selects tools step by step, and the Host executes each tool through the MCP Server. Claude never talks directly to Notion.

Streamable HTTP

in MCP:

1. Function definition and how it's meant to execute is not my headache, product owners create MCP servers for their product and they execute the functions for me.

how accurately does MCP would call the right API/ server for a given query?

MCP Servers.

Host - Vs code
